The increase in the number of available therapies has improved patient's quality of life.

Bleeding events and pain management are major limiting factors for patients.

Growing up with hemophilia can make patients feel isolated.

The rates of bleedings are decreasing with novel therapies.

Physical examination and ultrasounds are key to follow patients in the short-term.

In the long-term, this improvement should be associated with joint health status.

Treatment decisions now take into considerations patients' preferences and life goals.

Patients are still learning how to live with their condition while receiving treatment.
